EXAMINER

DELGADO, MICHAEL A

ART UNIT

PAPER NUMBER

2144

DATE MAILED: 09/07/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/992,511

Applicant(s)

RABBERS ET AL.

Examiner

Michael S. A. Delgado

Art Unit

2144

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 09 May 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-10, 11-19, 21-29, 31 and 33--60 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-10, 11-19, 21-29, 31 and 33--60 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 12 February 2002 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- ☒ Notice of References Cited (PTO-892)
- ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____.
- ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- ☐ Notice of Informal Patent Application (PTO-152)
- ☐ Other: _____.

DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claims 1-60 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claim 1-9, 11-19, 21-29, 31, 33-41, 43-46, 48-51, 53-56, 58-60 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent No. 6,477,543 by Huang in view of US Patent No. 6,636,873 by Carini et al.

In claim 1, Huang teaches about a method, comprising:

establishing a connection between a server "Replica Host" and a synchronization client "Synchronization Proxy" associated with a handheld device "Client", the server having a first database (data store in 402) and the handheld device having a second database (data store in 202), the handheld device having an application to allow a user to access the second database, wherein the synchronization client to use the connection in a synchronization operation of the second database and the first database (Huang Col 1, lines 50-60) (Huang Col 7, lines 25-30)

Art Unit: 2144

(Huang Col 7, lines 45-55) (Huang Col 8, lines 10-20) (Huang Col 8, lines 55-65) (Huang Col 9, lines 29-33);

receiving, from the server, first information indicative of a structure “format” of the first database (Huang Col 8, lines 20-35) (Huang Col 13, lines 35-45); This information is embedded in the sync logic that is past to synchronization proxy.

receiving, from the server, second information indicative of a version of the application from the server (Huang Col 13, lines 35-45) (Huang Col 14, lines 20-30); This information is embedded in the sync logic that is past to synchronization proxy.

sending, to the server, information of transactions performed on the second database by a user via the handheld device (Huang Col 13, lines 50-60);

receiving metadata from the server to update the application on the handheld device when the application has been updated since a previous synchronization operation (Huang Col 13, lines 40-50); and (metadata information that convey the adjustment moving from a high resolution to a Handheld Palm Pilot screen).

But does not explicitly teach about the server receiving filter information that is used to create a filtered data base that is used for future data synchronization between server and handheld device. Carini teaches about a methods and systems for synchronization of mobile devices with a remote database. The approach of filtering was employed to reduce replication of a subset of image of an enterprise database. The data that was synchronized with the handheld device (Mobile computing device) was filter to avoid replication on the handheld device (Col 3, line 65- Col 4, line 30) (Col 7, lines 20-40).

Art Unit: 2144

Handheld devices are small and only have a small amount of memory. The limitation in memory requires a filtering operation that allows only the most relevant information with respect to the application that is being executed to be store.

It would have been obvious for some one of ordinary skill at the time of the invention to use a filtering operation to better utilize the limited memory of a handheld device.

In claim 2, Huang combined with Carini, teaches about a method of claim 1, further comprising determining whether the structure of the first database has been updated since the previous synchronization operation (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 3, Huang combined with Carini, combined with Carini, combined with Carini, teaches about a method of claim 2, wherein determining whether the structure of the first database has been updated since the previous synchronization operation, comprises:

comparing the first information with information stored on the handheld device that is indicative of the structure of the first database when the previous synchronization operation was performed (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 4, Huang combined with Carini, combined with Carini, teaches about method of claim 2, wherein receiving, from the server, one of the filtered data or a subset of the filtered data that has changed since the previous synchronization operation data the first database to update the second database, comprises (Covered in claim 1):

receiving, from the server, a first set of data extracted from the first database when the structure of the first database has been updated since the previous synchronization operation, the

Art Unit: 2144

first set of data including data that has not changed in the second database since the previous synchronization operation was performed (Huang Col 10, lines 15-25) (Huang Col 13, lines 35-45) (Huang Col 13, lines 50-60). Steps involve when updating email from a Lotus Notes source.

In claim 5, Huang combined with Carini, combined with Carini, teaches about a method of claim 2, wherein receiving, from the server, one of the filtered data or a subset of the filtered data that has changed since the previous synchronization operation to update the second database, comprises (Covered in claim 1):

receiving, from the server, a second set of data extracted from the first database when the structure of the first database has not been updated since the previous synchronization operation, the second set of data not including data that has not changed in the second database since the previous synchronization operation was performed (Huang Col 10, lines 15-25) (Huang Col 13, lines 50-60). Steps involve when updating an address book application.

In claim 6, Huang combined with Carini, combined with Carini, teaches about a method of claim 1, further comprising determining whether the application has been updated since the previous synchronization operation (Huang Col 13, lines 50-60).

In claim 7, Huang combined with Carini, combined with Carini, teaches about a method of claim 6, wherein determining whether the application has been updated since the previous synchronization operation, comprises:

comparing the second information with information stored on the handheld device that is indicative of the version of the application when the previous synchronization operation was performed (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

Art Unit: 2144

In claim 8, Huang combined with Carini, teaches about a method of claim 1, wherein sending, to the server, information of transactions performed on the second database, comprises:

receiving, from the server, an identifier of information of a last transaction received by the server (Huang Col 14, lines 20-30); and

sending, to the server, transaction information that includes an identifier for each transaction “update history” made after the last transaction received by the server (Huang Col 14, lines 20-30).

In claim 9, Huang combined with Carini, teaches about a method of claim 8, wherein sending to the server information of transactions performed on the second database, further comprises:

receiving, from the server, error information when the server detects a transaction error (Huang Col 14, lines 35-40);

providing an indication of the error information to a user (Huang Col 14, lines 12-18);
and

receiving input from the user to process the transaction error (Huang Col 14, lines 12-18).

In claim 11, Huang combined with Carini, teaches about a system, comprising:

means for establishing a connection between a server “Replica Host” and a synchronization client “Synchronization Proxy” associated with a handheld device “Client”, the server having a first database (data store in 402) and the handheld device having a second

Art Unit: 2144

database (data store in 202), the handheld device having an application to allow a user to access the second database, wherein the synchronization client to use the connection in a synchronization operation of the second database and the first database (Huang Col 1, lines 50-60) (Huang Col 7, lines 25-30) (Huang Col 7, lines 45-55) (Huang Col 8, lines 10-20) (Huang Col 8, lines 55-65) (Huang Col 9, lines 29-33);

means for receiving, from the server, first information indicative of a structure “format” of the first database (Huang Col 8, lines 20-35) (Huang Col 13, lines 35-45); This information is embedded in the sync logic that is past to synchronization proxy.

means for receiving, from the server, second information indicative of a version of the application from the server (Huang Col 13, lines 35-45) (Huang Col 14, lines 20-30); This information is embedded in the sync logic that is past to synchronization proxy.

means for sending, to the server, information of transactions performed on the second database by a user via the handheld device (Huang Col 13, lines 50-60);

means for receiving metadata from the server to update the application on the handheld device when the application has been updated since a previous synchronization operation (Huang Col 13, lines 40-50); and (metadata information that convey the adjustment moving from a high resolution to a Handheld Palm Pilot screen).

means for sending, to the server, user-specific filter information (Covered in claim 1);

means for identifying, in the first database, data visible to the user of the synchronization client (Covered in claim 1);

means for filtering the identified data based on the user-specific filter information (Covered in claim 1) and

means for receiving, from the server, one of the filtered data or a subset of the filtered data that has changed since the previous synchronization operation data. (Covered in claim 1).

In claim 12, Huang combined with Carini, teaches about a system of claim 11, further comprising means for determining whether the structure of the first database has been updated since the previous synchronization operation (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 13, Huang combined with Carini, teaches about a system of claim 12, wherein the means for determining, comprises:

means for comparing the first information with information stored on the handheld device that is indicative of the structure of the first database when the previous synchronization operation was performed (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 14, Huang combined with Carini, teaches about a method of claim 2, wherein the means for receiving, from the server, one of the filtered data or a subset of the filtered data that has changed since the previous synchronization operation to update the second database, comprises (Covered in claim 1):

means for receiving, from the server, a first set of data extracted from the first database when the structure of the first database has been updated since the previous synchronization operation, the first set of data including data that has not changed in the second database since the previous synchronization operation was performed (Huang Col 10, lines 15-25) (Huang Col

Art Unit: 2144

13, lines 35-45) (Huang Col 13, lines 50-60). Steps involve when updating email from a Lotus Notes source.

In claim 15, Huang combined with Carini, teaches about method of claim 2, wherein the means for receiving, from the server, one of the filtered data or a subset of the filtered data that has changed since the previous synchronization operation to update the second database, comprises (Covered in claim 1):

means for receiving, from the server, a second set of data extracted from the first database when the structure of the first database has not been updated since the previous synchronization operation, the second set of data not including data that has not changed in the second database since the previous synchronization operation was performed (Huang Col 10, lines 15-25) (Huang Col 13, lines 50-60). Steps involve when updating an address book application.

In claim 16, Huang combined with Carini, teaches about a system of claim 11, further comprising means for determining whether the application has been updated since the previous synchronization operation (Huang Col 13, lines 50-60).

In claim 17, Huang combined with Carini, teaches about a system of claim 16, wherein the means for determining whether the application has been updated since the previous synchronization operation, comprises:

means for comparing the second information with information stored on the handheld device that is indicative of the version of the application when the previous synchronization operation was performed (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 18, Huang combined with Carini, teaches about a system of claim 11, wherein the means for sending, to the server, information of transactions performed on the second database, comprises:

means for receiving, from the server, an identifier of information of a last transaction received by the server (Huang Col 14, lines 20-30); and

means for sending, to the server, transaction information that includes an identifier for each transaction “update history” made after the last transaction received by the server (Huang Col 14, lines 20-30).

In claim 19, Huang combined with Carini, teaches about a system of claim 18, wherein the means for sending to the server information of transactions performed on the second database, further comprises:

means for receiving, from the server, error information when the server detects a transaction error (Huang Col 14, lines 35-45);

means for providing an indication of the error information to a user (Huang Col 14, lines 12-18); and

means for receiving input from the user to process the transaction error (Huang Col 14, lines 12-18).

In claim 21, Huang combined with Carini, teaches about a machine-readable medium having stored thereon a plurality of instructions that when executed by a computer cause the computer to perform operations comprising (Huang Col 26, lines 38-50):

establishing a connection between a server “Replica Host” and a synchronization client “Synchronization Proxy” associated with a handheld device “Client” , the server having a first database (data store in 402) and the handheld device having a second database (data store in 202), the handheld device having an application to allow a user to access the second database, wherein the synchronization client to use the connection in a synchronization operation of the second database and the first database (Huang Col 1, lines 50-60) (Huang Col 7, lines 25-30) (Huang Col 7, lines 45-55) (Huang Col 8, lines 10-20) (Huang Col 8, lines 55-65) (Huang Col 9, lines 29-33);

receiving, from the server, first information indicative of a structure “format” of the first database (Huang Col 8, lines 20-35) (Huang Col 13, lines 35-45); This information is embedded in the sync logic that is past to synchronization proxy.

receiving, from the server, second information indicative of a version of the application from the server (Huang Col 13, lines 35-45) (Huang Col 14, lines 20-30); This information is embedded in the sync logic that is past to synchronization proxy.

sending, to the server, information of transactions performed on the second database by a user via the handheld device (Huang Col 13, lines 50-60);

receiving metadata from the server to update the application on the handheld device when the application has been updated since a previous synchronization operation (Huang Col 13, lines 40-50); and (metadata information that convey the adjustment moving from a high resolution to a Handheld Palm Pilot screen).

sending, to the server, filter information (Covered in claim 1);

filtering data based on the filter information (Covered in claim 1);

and receiving, from the server, one of the filtered data or a subset of the filtered data that has changed since the previous synchronization operation to update the second database (Covered in claim 1).

In claim 22, Huang combined with Carini, teaches about a machine-readable medium of claim 22, wherein the instructions for performing the operation of receiving, from the server, one of the filtered data or a subset of the filtered data that has changed since the previous synchronization operation to update the second database, include instructions that when executed by the computer cause the computer to perform operations comprising (Covered in claim 1):

determining whether the structure of the first database has been updated since the previous synchronization operation (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 23, Huang combined with Carini, teaches about a machine-readable medium of claim 22, wherein the instructions for performing the operation of receiving, from the server, one of the filtered data or a subset of the filtered data that has changed since the previous synchronization operation to update the second database, include instructions that when executed by the computer cause the computer to perform operations comprising (Covered in claim 1):

comparing the first information with information stored on the handheld device that is indicative of the structure of the first database when the previous synchronization operation was performed (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 24, Huang combined with Carini, teaches about a machine-readable medium of claim 22, wherein the instructions for performing the operation of receiving, from the server,

Art Unit: 2144

data extracted from the first database to update the second database, include instructions that when executed by the computer cause the computer to perform operations comprising:

receiving, from the server, a first set of data extracted from the first database when the structure of the first database has been updated since the previous synchronization operation, the first set of data including data that has not changed in the second database since the previous synchronization operation was performed (Huang Col 10, lines 15-25) (Huang Col 13, lines 35-45). (Huang Col 13, lines 50-60). Steps involve when updating email from a Lotus Notes source.

In claim 25, Huang combined with Carini, teaches about a machine-readable medium of claim 22, wherein the instructions for performing the operation of receiving, from the server, data extracted from the first database to update the second database, include instructions that when executed by the computer cause the computer to perform operations comprising:

receiving, from the server, a second set of data extracted from the first database when the structure of the first database has not been updated since the previous synchronization operation, the second set of data not including data that has not changed in the second database since the previous synchronization operation was performed (Huang Col 10, lines 15-25) (Huang Col 13, lines 50-60). Steps involve when updating an address book application.

In claim 26, Huang combined with Carini, teaches about a machine-readable medium of claim 21, wherein the plurality of instructions further comprises instructions that when executed by the computer cause the computer to perform operations comprising:

determining whether the application has been updated since the previous synchronization operation (Huang Col 13, lines 50-60).

In claim 27, Huang combined with Carini, teaches about a machine-readable medium of claim 26, wherein the instructions for performing the operation of determining whether the application has been updated since the previous synchronization operation, include instructions that when executed by the computer cause the computer to perform operations comprising:

comparing the second information with information stored on the handheld device that is indicative of the version of the application when the previous synchronization operation was performed (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 28, Huang combined with Carini, teaches about a machine-readable medium of claim 21, wherein the instructions for performing the operation of sending, to the server, information of transactions performed on the second database, include instructions that when executed by the computer cause the computer to perform operations comprising:

receiving, from the server, an identifier of information of a last transaction received by the server (Huang Col 14, lines 20-30); and

sending, to the server, transaction information that includes an identifier for each transaction "update history" made after the last transaction received by the server (Huang Col 14, lines 20-30).

In claim 29, Huang combined with Carini, teaches about a machine-readable medium of claim 28, wherein the instructions for sending to the server information of transactions performed on the second database, include instructions that when executed by the computer cause the computer to perform operations comprising:

Art Unit: 2144

receiving, from the server, error information when the server detects a transaction error (Huang Col 14, lines 35-40);

providing an indication of the error information to a user (Huang Col 14, lines 12-18);
and

receiving input from the user to process the transaction error (Huang Col 14, lines 12-18).

In claim 31, Huang combined with Carini, teaches about a handheld device, comprising (Fig 2):

a local database (Fig 2, 202);

a user interface (key pad on handheld) coupled to the local database (Huang Col 1, lines 50-60);

a transaction recorder coupled to the local database, wherein the transaction recorder to record information related to changes made to the local database by a user of the handheld device via the user interface and to provide the recorded information to a server during a synchronization operation (Huang Col 14, lines 20-30);

a metadata importer (sync logic combine with transformation code) coupled to the user interface, wherein the metadata importer to receive metadata from the server during the synchronization operation, the metadata including information for updating the user interface (the display)(Huang Col 13, lines 40-50); and

a data importer coupled to the local database, wherein the data importer to receive data provided by the server during the synchronization operation, the data being extracted from a main database based on visibility rules and filter information or being a subset of the extracted

Art Unit: 2144

data representing a part of the extracted data that has changed since a previous synchronization operation by the server (Covered in claim 1) (Huang Col 13, lines 35-50).

In claim 33, Huang combined with Carini, teaches about a handheld device of claim 31, wherein the data importer further to determine whether a structure of the main database has been changed since previous synchronization operation (Huang Col 13, lines 50-60).

In claim 34, Huang combined with Carini, teaches about a handheld device of claim 33, wherein the data importer to receive an identifier corresponding to the structure of the main database and compare the received identifier with a stored identifier corresponding to the structure of the main database when the previous synchronization operation was performed (Huang Col 13, lines 40-45) (Huang Col 13, lines 50-60).

In claim 35, Huang combined with Carini, teaches about a handheld device of claim 33, wherein the data importer to receive a first set of data extracted from the main database by the server when the structure of the main database has changed since the previous synchronization operation, the first set of data including data that has not changed in the local database since the previous synchronization operation was performed (Huang Col 10, lines 15-25) (Huang Col 13, lines 35-45) (Huang Col 13, lines 50-60). Steps involve when updating email from a Lotus Notes source.

In claim 36, Huang combined with Carini, teaches about a handheld device of claim 33, wherein the data importer to receive a second set of data extracted from the main database by the server when the structure of the main database has not changed since the previous synchronization operation, the second set of data omitting data that has not changed in the local database since the previous synchronization operation was performed (Huang Col 10, lines 15-25) (Huang Col 13, lines 50-60). Steps involve when updating an address book application..

In claim 37, Huang combined with Carini, teaches about a handheld device of claim 31, wherein the metadata importer to determine whether the user interface has been updated since the previous synchronization operation (Huang Col 13, lines 50-60).

In claim 38, Huang combined with Carini, teaches about a handheld device of claim 37, wherein the metadata importer to receive version information of a most currently available user interface and to compare the received version information with version information corresponding to the user interface included in the handheld device (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 39, Huang combined with Carini, teaches about a handheld device of claim 31, wherein the transaction recorder to receive from the server an identifier of a last transaction recorded by the transaction for which transaction information was received by the server from the handheld device and to send to the server transaction information that includes an identifier

Art Unit: 2144

for each transaction made after the last transaction (Huang Col 13, lines 50-60) (Huang Col 14, lines 20-30).

In claim 40, Huang combined with Carini, teaches about a handheld device of claim 39, wherein the transaction recorder to receive from the server error information when the server detects a transaction error, to provide an indication of the error information to a user, and to receive input from the user to process the transaction error (Huang Col 14, lines 12-25) (Huang Col 14, lines 35-40).

In claim 41, Huang combined with Carini, teaches about a method, comprising:

establishing a connection between a server "Replica Host" and a synchronization client "Synchronization Proxy" associated with a handheld device "Client", the server having a first database (data store in 402) and the handheld device having a second database (data store in 202), the handheld device having an application to allow a user to access the second database, wherein the synchronization client to use the connection in a synchronization operation of the second database and the first database (Huang Col 1, lines 50-60) (Huang Col 7, lines 25-30) (Huang Col 7, lines 45-55) (Huang Col 8, lines 10-20) (Huang Col 8, lines 55-65) (Huang Col 9, lines 29-33);

receiving first filter information (first application on the list) from the server, the first filter information including at least one business object "address book", each business object having an associated set of filters (name, phone number, address, email, etc) (Huang Col 10, lines 10-25) (Huang Col 11, lines 35-45) ;

Art Unit: 2144

retrieving second filter information stored on the handheld device, the second filter information including at least one business object, each business object having an associated filter that was active during a previous synchronization operation (Huang Col 10, lines 10-25) (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60); (updating address book with new changes).

processing the first filter and second filter information to select active filters (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60); (This is the process of deciding which subset of data is most current).

storing the processed filter information to serve as the second filter information for a next synchronization operation (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60); and

sending the processed filter information to the server during the synchronization operation (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60).

In claim 43, Huang combined with Carini, teaches about a method of claim 41, wherein processing the first filter and second filter information to select active filters, comprises:

for each business object included in the first filter information, selecting a default filter (transformation code) associated with the business object in the first filter information as the business objects active filter (Huang Col 10, lines 20-30) (Huang Col 11, lines 33-45);

each business object and associated filter in the second filter information that is also included in the first filter information, selecting the associated filter of the second filter information as the business object's active filter (Huang Col 13, lines 50-60).

In claim 44, Huang combined with Carini, teaches about a method of claim 43, wherein selecting a default filter associated with the business object in the first filter information as the business object's active filter, comprises:

forming a linked list of each business object and its associated set of filters (Huang Col 3, lines 20-30) (Huang Col 11, lines 33-45); and

for each business object of the first filter information, selecting a first found default filter as the business object's active filter (Huang Col 10, lines 20-30) (Huang Col 11, lines 35-45).

In claim 45, Huang combined with Carini, teaches about a method of claim 44, wherein selecting the associated filter of the second filter information as the business object's active filter, comprises:

for each business object of the second filter information, determining whether the business object and its associated filter in the second filter information is also present in the linked list (Huang Col 8, lines 40-45); and

for each business object and associated filter of the second filter information that is present in the linked list, selecting the associated filter of the second filter information as the active filter (Huang Col 13, lines 50-60).

In claim 46, Huang combined with Carini, teaches about a system, comprising:

means for establishing a connection between a server "Replica Host" and a synchronization client "Synchronization Proxy" associated with a handheld device "Client", the server having a first database (data store in 402) and the handheld device having a second database (data store in 202), the handheld device having an application to allow a user to access

Art Unit: 2144

the second database, wherein the synchronization client to use the connection in a synchronization operation of the second database and the first database (Huang Col 1, lines 50-60) (Huang Col 7, lines 25-30) (Huang Col 7, lines 45-55) (Huang Col 8, lines 10-20) (Huang Col 8, lines 55-65) (Huang Col 9, lines 29-33);

means for receiving first filter information (first application on the list) from the server, the first filter information including at least one business object "address book", each business object having an associated set of filters (name, phone number, address, email, etc) (Huang Col 10, lines 10-25) (Huang Col 11, lines 35-45) ;

means for retrieving second filter information stored on the handheld device, the second filter information including at least one business object, each business object having an associated filter that was active during a previous synchronization operation (Huang Col 10, lines 10-25) (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60); (updating address book with new changes).

means for processing the first filter and second filter information to select active filters (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60); (This is the process of deciding which subset of data is most current).

means for storing the processed filter information to serve as the second filter information for a next synchronization operation (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60) ;
and

means for sending the processed filter information to the server during the synchronization operation (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60).

Art Unit: 2144

In claim 48, Huang combined with Carini, teaches about a method of claim 41, wherein the means for processing the first filter and second filter information to select active filters, comprises:

means for each business object included in the first filter information, selecting a default filter (transformation code) associated with the business object in the first filter information as the business objects active filter (Huang Col 10, lines 20-30) (Huang Col 11, lines 33-45);

means for each business object and associated filter in the second filter information that is also included in the first filter information, selecting the associated filter of the second filter information as the business object's active filter (Huang Col 13, lines 50-60).

In claim 49, Huang combined with Carini, teaches about a method of claim 43, wherein means for selecting a default filter associated with the business object in the first filter information as the business object's active filter, comprises:

forming a linked list of each business object and its associated set of filters (Huang Col 3, lines 20-30) (Huang Col 11, lines 33-45); and

for each business object of the first filter information, selecting a first found default filter as the business object's active filter (Huang Col 10, lines 20-30) (Huang Col 11, lines 35-45).

In claim 50, Huang combined with Carini, teaches about a method of claim 44, wherein the means for selecting the associated filter of the second filter information as the business object's active filter, comprises:

means for each business object of the second filter information, determining whether the business object and its associated filter in the second filter information is also present in the linked list (Huang Col 8, lines 40-45); and

Art Unit: 2144

means for each business object and associated filter of the second filter information that is present in the linked list, selecting the associated filter of the second filter information as the active filter (Huang Col 13, lines 50-60).

In claim 51, Huang combined with Carini, teaches about a machine-readable medium having stored thereon a plurality of instructions that when executed by a computer cause the computer to perform operations include instructions that when executed by the computer cause the computer to perform operations comprising (Huang Col 26, lines 38-45):

establishing a connection between a server “Replica Host” and a synchronization client “Synchronization Proxy” associated with a handheld device “Client”, the server having a first database (data store in 402) and the handheld device having a second database (data store in 202), the handheld device having an application to allow a user to access the second database, wherein the synchronization client to use the connection in a synchronization operation of the second database and the first database (Huang Col 1, lines 50-60) (Huang Col 7, lines 25-30) (Huang Col 7, lines 45-55) (Huang Col 8, lines 10-20) (Huang Col 8, lines 55-65) (Huang Col 9, lines 29-33);

receiving first filter information (first application on the list) from the server, the first filter information including at least one business object “address book”, each business object having an associated set of filters (name, phone number, address, email, etc) (Huang Col 10, lines 10-25) (Huang Col 11, lines 35-45) ;

retrieving second filter information stored on the handheld device, the second filter information including at least one business object, each business object having an associated

Art Unit: 2144

filter that was active during a previous synchronization operation (Huang Col 10, lines 10-25) (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60); (updating address book with new changes).

processing the first filter and second filter information to select active filters (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60); (This is the process of deciding which subset of data is most current).

storing the processed filter information to serve as the second filter information for a next synchronization operation (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60); and

sending the processed filter information to the server during the synchronization operation (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60).

In claim 53, Huang combined with Carini, teaches about a machine-readable medium of claim 51, wherein the instructions for performing the operation of processing the first filter and second filter information to select active filters include instructions that when executed by the computer cause the computer to perform operations comprising (Huang Col 26, lines 38-45):

for each business object included in the first filter information, selecting a default filter (transformation code) associated with the business object in the first filter information as the business objects active filter (Huang Col 10, lines 20-30) (Huang Col 11, lines 33-45);

each business object and associated filter in the second filter information that is also included in the first filter information, selecting the associated filter of the second filter information as the business object's active filter (Huang Col 13, lines 50-60).

Art Unit: 2144

In claim 54, Huang combined with Carini, teaches about a machine-readable medium of claim 53, wherein the instructions for performing the operation of selecting a default filter associated with the business object in the first filter information as the business object's active filter include instructions that when executed by the computer cause the computer to perform operations comprising (Huang Col 26, lines 38-45):

forming a linked list of each business object and its associated set of filters (Huang Col 3, lines 20-30) (Huang Col 11, lines 33-45); and

for each business object of the first filter information, selecting a first found default filter as the business object's active filter (Huang Col 10, lines 20-30) (Huang Col 11, lines 35-45).

In claim 55, Huang combined with Carini, teaches about a machine-readable medium of claim 54, wherein the instructions for performing the operation of selecting the associated filter of the second filter information as the business object's active filter include instructions that when executed by the computer cause the computer to perform operations comprising (Huang Col 26, lines 38-45):

for each business object of the second filter information, determining whether the business object and its associated filter in the second filter information is also present in the linked list (Huang Col 8, lines 40-45); and

for each business object and associated filter of the second filter information that is present in the linked list, selecting the associated filter of the second filter information as the active filter (Huang Col 13, lines 50-60).

Art Unit: 2144

In claim 56, Huang combined with Carini, teaches about a handheld device, comprising:
a memory (Fig 2, “storage memory”);
a local database (Fig 2, 202);
a user interface (key pad on handheld) coupled to the local database (Huang Col 1, lines 50-60);

a transaction recorder coupled to the local database, wherein the transaction recorder to record information related to changes made to the local database by a user of the handheld device via the user interface and to provide the recorded information to a server during a synchronization operation (Huang Col 14, lines 20-30);

a data importer “sync handler” (Fig 2, 206) coupled to the local database, wherein the data importer to receive data provided by the server during the synchronization operation, and to store the data in the local database, the data being extracted from a main database and filtered by the server before being received by the data importer (Huang Col 8, lines 55-65) (Huang Col 11, lines 5-10) (Huang Col 11, lines 33-45) (Huang Col 13, lines 35-50).

a filter processor coupled to the memory, wherein the filter processor to (Huang Col 11, lines 33-45):

receive first filter information from the server, the first filter information including at least one business object “address book”, each business object having an associated set of filters (name, address, email, etc) (Huang Col 11, lines 33-45);

retrieve second filter information stored in the memory, the second filter information including at least one business object, each business object having an associated filter that was

Art Unit: 2144

active during a previous synchronization operation (Huang Col 11, lines 35-45) (Huang Col 13, lines 50-60);

process the first filter and second filter information to select active filters (Huang Col 13, lines 50-60);

store the processed filter information in the memory to serve as the second filter information for a next synchronization operation (Huang Col 13, lines 50-60); and

send the processed filter information to the server during the synchronization operation, the processed filter information to be used by the server in filtering the data extracted from the main database (Huang Col 13, lines 50-60).

In claim 58, Huang combined with Carini, teaches about a handheld device of claim 54, wherein in processing the first filter and second filter information to select active filters, the filter processor to:

for each business object included in the first filter information, select a default filter (transformation code) associated with the business object in the first filter information as the business objects active filter (Huang Col 10, lines 20-30) (Huang Col 11, lines 33-45);

for each business object and associated filter in the second filter information that is also included in the first filter information, select the associated filter of the second filter information as the business object's active filter (Huang Col 13, lines 50-60)..

Art Unit: 2144

In claim 59, Huang combined with Carini, teaches about a handheld device of claim 58, wherein in selecting a default filter associated with the business object in the first filter information as the business object's active filter, the filter processor to:

form a linked list of each business object and its associated set of filters (Huang Col 3, lines 20-30) (Huang Col 11, lines 33-45); and

for each business object of the first filter information, select a first found default filter as the business object's active filter (Huang Col 10, lines 20-30) (Huang Col 11, lines 35-45).

In claim 60, Huang combined with Carini, teaches about a handheld device of claim 59, wherein in selecting the associated filter of the second filter information as the business object's active filter, the filter processor to:

for each business object of the second filter information, determine whether the business object and its associated filter in the second filter information is also present in the linked list (Huang Col 8, lines 40-45); and

for each business object and associated filter of the second filter information that is present in the linked list, selecting the associated filter of the second filter information as the active filter (Huang Col 13, lines 50-60).

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person

Art Unit: 2144

having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claim 42, 47, 52 and 57 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent No. 6,477,543 by Huang and US Patent No. 6,636,873 by Carini et al in view of US Patent No. 6,564,263 by Bergman et al.

In claim 42, Huang combined with Carini, teaches all the limitation as to the processing of a first and second filter but does not explicitly teach about using XML in accomplishing the task.

Bergman teaches about a method to process multimedia using XML (Huang Col 14, lines 5-30).

In Huang's invention, handheld applications are synchronized by using sync logics and transformation codes (process codes) (Huang Col 8, lines 10-20). The many variation of handheld devices and their applications required a large number of different process codes, which was a burden to manage. As a result, Hung indicated the need for improvement (Huang Col 2, lines 5-25). Bergman teaches an improve way of reducing the number of process codes variations across multiple platforms by using the portability feature of XML (Huang Col 14, lines 10-20). With the portability feature, the same process code can be reused on different platform, which eliminated the need for individual custom-made code. The reduction in the number of process codes simplified the task of managing them.

It would have been obvious at the time of the invention for some one of ordinary skill to use the portability feature of XML and its additional benefit to reduce the number of process codes and the complexity that is need to manage them.

In claim 47, the system of claim 46, wherein the means for processing the first and second filter information comprises:
means for forming an XML document that includes each business object and its associated active filter (Covered in claim 42).

In claim 52, the machine-readable medium of claim 51, wherein the instructions for performing the operation of processing the first and second filter information include instructions that when executed by the computer cause the computer to perform operations comprising:
forming an XML document that includes each business object and its associated active filter (covered in claim 42).

In claim 57, the handheld device of claim 54, wherein the filter processor to form an XML document that includes each business object and its associated active filter (covered in claim 42).

Conclusion

3. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

Art Unit: 2144

however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

US 2002/0,010,807 by Multer et al, teaches about a data package including synchronization data.

US 2002/0,029,227 by Multer et al, teaches about a management server for a synchronization system.
